

STAKEHOLDER MANAGEMENT PLAN

Project Name AI Learning Environment (working name)

Name	About the Stakeholder	Plan
Aubin Chriss Izere and Chop Kur	Two Software Systems Engineering students building and self-funding the project as their two-term capstone. Both study from PDFs every week, so they have the problem the product solves.	Manage closely. • Weekly planning meeting to review the Kanban board, schedule and risks. • Every pull request is reviewed by the other member before it is merged. • Decisions and changes are recorded in the GitHub repository.
Dr. Tim Maciag	Course instructor for both capstone terms. Approves the project direction, reviews progress at workshop check-ins and team scrums (from 27 October), and grades every deliverable. Has the most influence over scope and schedule.	Manage closely. • Arrive at every check-in and scrum with an up-to-date Kanban board and GitHub repository, following the scrum work standard. • Raise scope or schedule changes early, in writing, with a change request. • Email between sessions when a decision is blocked rather than waiting for the next class.
Linda	Undergraduate who described re-uploading files to an AI assistant every session as the main friction in her studying. Interested in the outcome but has no formal role in the project.	Keep informed. • Invite her to test the prototype (20 October) and the working app (November). • Consult her on the explanation, flashcard and spaced-review features. • Send a short update at each major milestone.
Design-partner students	Undergraduates aged 18 to 25 from mixed programs, using Windows laptops, Macs and iPads. Willing to try a new tool if setup takes minutes, prefer short feedback sessions between classes, and need to see a learning benefit before switching from their current tools.	Keep informed and consult. • Recruit at least 5 for the fall usability tests and at least 15 for the winter pilot. • Keep sessions to about 15 minutes, using their own course files. • Collect feedback through a short form,

		and show them what changed because of it. • Give free Pro access during the pilot as thanks.
U of R undergraduate students	Students aged 18 to 24, mostly in 2nd to 4th year engineering, science and business, who study in 1 to 3 hour blocks from PDFs downloaded from UR Courses. Together they decide whether the product succeeds, but most do not know about it yet.	Keep satisfied. • Base features on interviews and usability results rather than assumptions. • Offer a free tier with no setup barrier and a plain-language privacy notice. • Reach them through word of mouth, starting with the design partners.
Graduate and thesis students	Students aged 22 to 30 who read many papers each week. They care about recall across many documents, summaries accurate enough to cite, and keeping unpublished material private.	Monitor. • Interview one or two graduate students in ENSE 477 to check the fit. • No features are built specifically for them during the capstone.
ENSE 400 capstone peers	Other capstone teams working on their own projects with the same deadlines. Their time for testing is limited.	Monitor. • Prepare a tight usability task of about 10 minutes for 20 October. • Test their projects in return. • Share usability results and progress at bazaar day on 24 November.
Cultivator HQ mentors	Mentors at the Cultivator startup incubator who hear the 5-minute final pitch. They can offer business advice and connections if the product shows promise.	Monitor. • Deliver a clear 5-minute pitch covering the problem, UVP and business model. • Note their feedback and contacts, and follow up by email with anyone who shows interest.
AI model providers	External services the product depends on. They can change prices, free-tier rate limits or terms without notice, and they have no specific interest in the project.	Keep satisfied. • Follow each provider's terms of use. • Check pricing, free-tier limits and data-use terms every month. • Keep at least two free providers working so one change cannot stop the app.

		• Tell students how each provider uses the text they send.
Course instructors and textbook publishers	Most do not know about the project. They could object if the app copied, stored or redistributed their materials.	Keep satisfied. • Send only the selected passage to the AI model; never upload, store or share whole course files. • State this clearly in the privacy notice. • Ask Dr. Maciag for guidance on using course materials during testing.
