Funza — low-fidelity wireframes

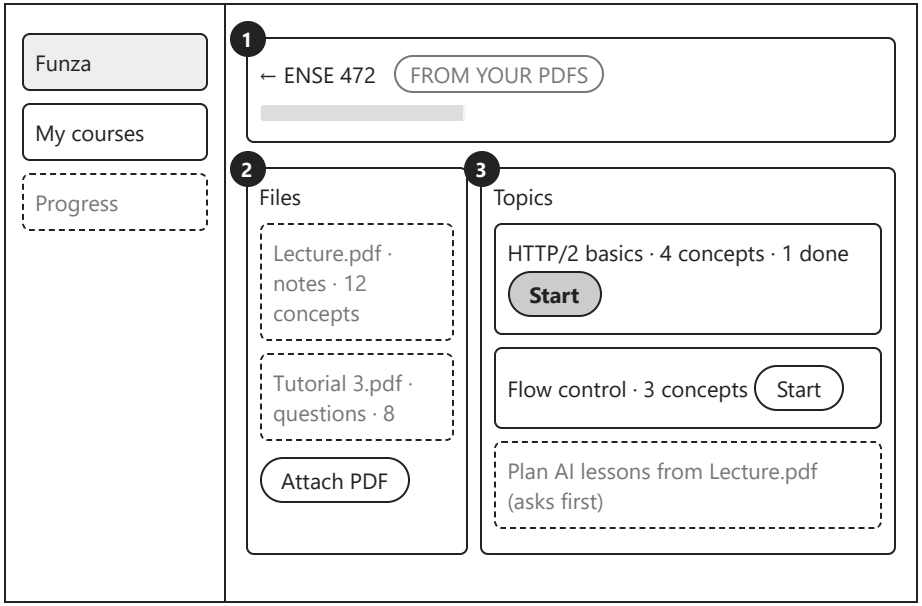

Version 1, 19 October 2026 · Aubin Chriss Izere and Chop Kur, ENSE 400 · Five screens, grey boxes only. Each screen lists what we want to learn from participants; the numbered callouts are the parts we ask about.

1. Home — my courses

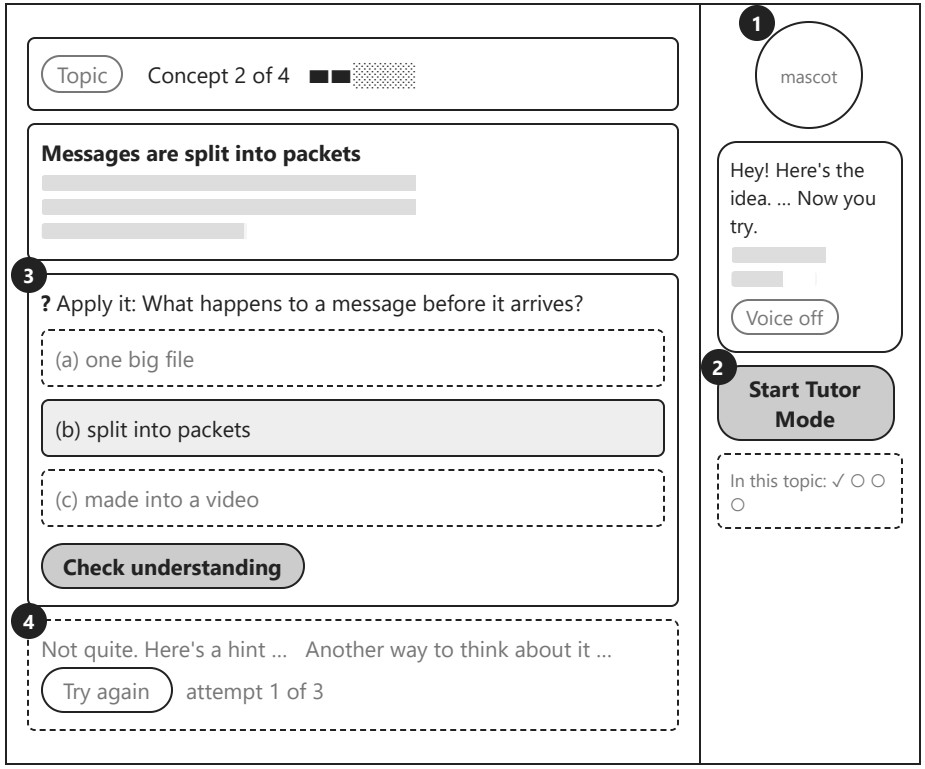

1. **Greeting.** Does a first-time student know this is a study app, not a chat bot?
2. **Add course.** Is it obvious that a course comes from the student's own PDFs?
3. **Sample badge.** Do students understand "sample" means built-in lessons, and that they can delete it?

2. Course page — PDFs and topics

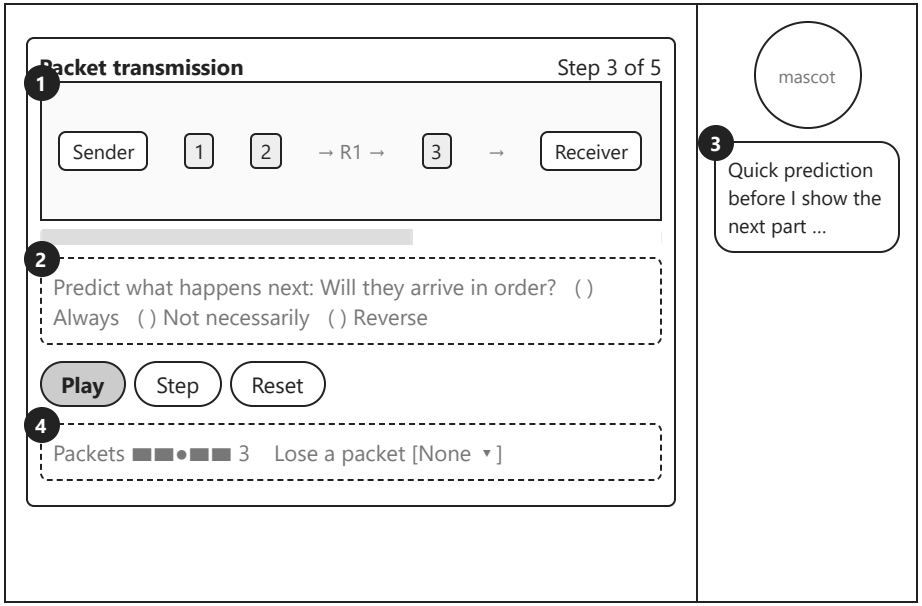

1. **Source banner.** Is "from your PDFs" versus "sample" versus "adaptive AI" clear and reassuring?
2. **Files.** Does the notes/questions split make sense? Would they flip a wrong classification?
3. **Topics.** Is "concept" the right word? Do they want to pick a concept directly?

3. Lesson — explain, ask, hint

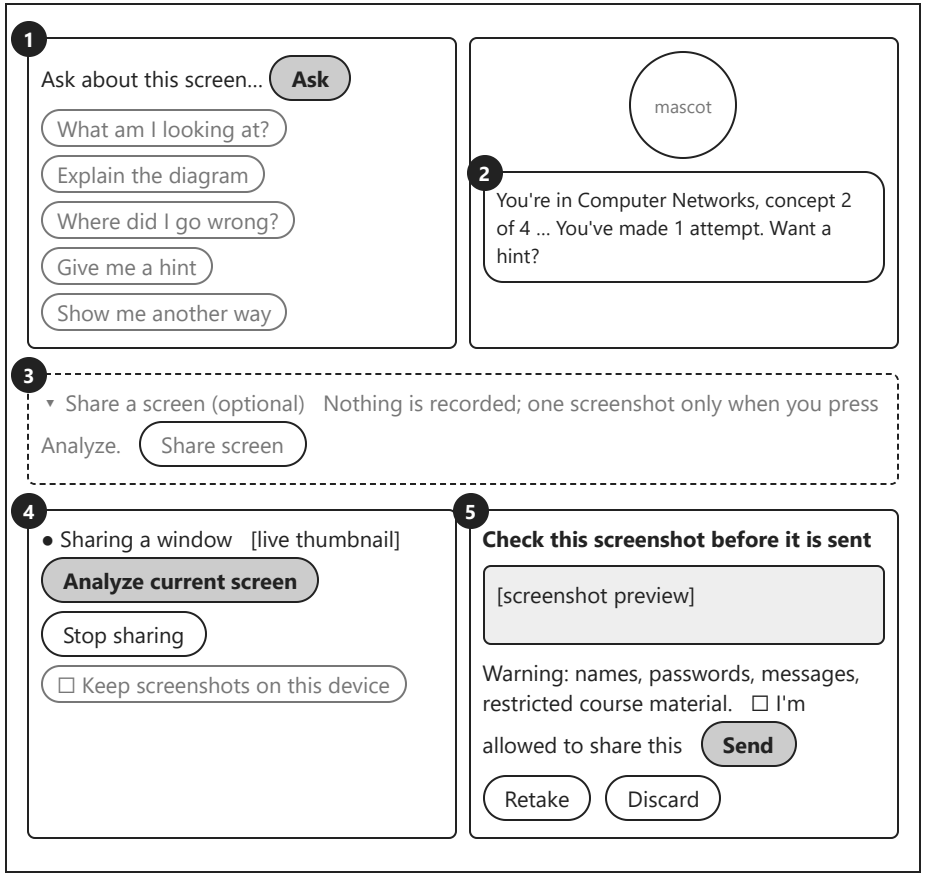

1. **Mascot and bubble.** Tutor or gimmick? Do they turn the voice on?
2. **Tutor Mode.** Do they understand it narrates the whole topic and waits for them?
3. **Question.** Do they read the explanation first or go straight to the options?
4. **Hint instead of answer.** Helpful or annoying? Is "3 attempts before the answer" fair?

4. Lesson with an interactive demo

1. **Animation.** Does the picture explain more than the text? Are the captions read?
2. **Prediction stop.** Do they realise the demo stopped on purpose, and that nothing is revealed until they answer?
3. **Mascot sync.** Does the mascot saying the same thing as the demo help or feel like noise?
4. **Sliders.** Do they discover the settings? Do they try a second run?

5. Ask Funza about this screen (and optional screen share)

1. **Ask box.** Do they type, or use the buttons? Is it clear it knows the current question?
2. **Answer.** Useful, or just repeating the screen? Does it give away answers?
3. **Opt-in sharing.** Would they ever press this? What do they expect it to see?
4. **While sharing.** Is the indicator reassuring enough? Is Stop easy to find?
5. **Review before send.** Does the consent step feel like safety or friction?

Low fidelity on purpose: layout and flow only, no colour, no copy. The high-fidelity prototype is the working app in `app/` (run with `npm run dev`). Use these sheets when a pairing wants to talk about structure rather than click through, and to mark up changes with a pen during the debrief.
